1. (a.) (10 pts) Find ALL the eigenvalues and ONE eigenvector of each of the matrices below:

$$A = \begin{bmatrix} 0 & 0 & 1 \\ 0 & 5 & 0 \\ -2 & 0 & 3 \end{bmatrix} \quad B = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 5 & 0 \\ -3 & 0 & -2 \end{bmatrix}$$

is an eigenvector of A and B.

$$\begin{bmatrix} 0 \\ 1 \\ 0 \end{bmatrix} \text{ is an eigenvector of } A \text{ and } B.$$

$$\det(A - \lambda I) = (5 - \lambda) \begin{vmatrix} -\lambda & -1 \\ -2 & 3 - \lambda \end{vmatrix} = (5 - \lambda)(\lambda^2 - 3\lambda + 2) \Rightarrow \lambda = -1, -2, 5$$

$$B \text{ is lower triangular. The eigenvalues are on the diagonal: } 1, 5, -2.$$

1. (b.) (10 pts) Find ONLY one eigenvalue of each of the matrices below: (This can be done with no arithmetic.)

$$A = \begin{bmatrix} 1 & 2 & 3 & 4 \\ 5 & 6 & 7 & 8 \\ 9 & 10 & 11 & 12 \\ 13 & 14 & 15 & 16 \end{bmatrix} \quad B = \begin{bmatrix} 3 & 1 & 1 \\ 1 & 3 & 1 \\ 1 & 1 & 3 \end{bmatrix}$$

A is singular since column $1 + \text{column } 3 = 2 \times \text{column } 2$. So A has an eigenvalue 0.

$$B\left(\begin{array}{c}1\\1\\1\end{array}\right) = \left(\begin{array}{c}5\\5\\5\end{array}\right)$$

so 5 is an eigenvalue of B.

- **2.** (20 pts) Let A have eigenvalues $\lambda_1, \ldots, \lambda_n$ (all nonzero) and corresponding eigenvectors x_1, \ldots, x_n forming a basis for \mathbb{R}^n . Let C be its cofactor matrix. (The answers to the questions below should be in terms of the λ_i .)
 - (a) (5 pts) What is $trace(A^{-1})$? $det(A^{-1})$?
 - (b) (15 pts) What is $\operatorname{trace}(C)$? What is $\det(C)$? (Hint: $A^{-1} = \frac{C^T}{\det A}$)
 - (a) A^{-1} has eigenvalues $\frac{1}{\lambda_1}, \dots, \frac{1}{\lambda_n}$. $\operatorname{trace}(A^{-1}) = \frac{1}{\lambda_1} + \dots + \frac{1}{\lambda_n}$ $\det(A^{-1}) = \frac{1}{\lambda_1} \frac{1}{\lambda_2} \dots \frac{1}{\lambda_n}$. (b) The eigenvalues of C^T are the same as that of C or $\det(A) \times$ those of A^{-1} . Thus they are $\mu_i = \frac{\lambda_1 \lambda_2 \dots \lambda_n}{\lambda_i}$ $\operatorname{trace}(C) = \lambda_1 \lambda_2 \dots \lambda_n (\frac{1}{\lambda_1} + \dots + \frac{1}{\lambda_n})$ $\det(C) = (\lambda_1 \dots \lambda_n)^{n-1}$

3. (30 pts.) Suppose A is symmetric $(n \times n)$ with rank r = 1 and one eigenvalue equal to 7. Let the general solution to

$$\frac{du}{dt} = -Au$$

be written as u(t) = M(t)u(0). (Note the minus sign!)

- (a) (5 pts.) Write down an expression for M(t) in terms of A and t.
- (b) (15 pts.) Is it true that for all t, $\operatorname{trace}(M(t)) \ge \det(M(t))$? Explain your answer by finding all the eigenvalues of M(t).
- (c) (5 pts.) Can u(t) blow up when $t \to \infty$? Explain.
- (d) (5 pts.) Can u(t) approach 0 when $t \to \infty$? Explain.
 - (a) $M(t) = e^{-At}$
 - (b) M(t) has one eigenvalue e^{-7t} and the rest are 1.
 - (c) No blow up. All eigs are ≤ 1 .
 - (d) If u(0) is the eigenvector corresponding to to e^{7t} then u(t) approaches 0.

4. (30pts.) (a). If B is invertible prove that AB has the same eigenvalues as BA. (Hint: Find a matrix M such that ABM = MBA.)

$$M = B^{-1}$$
 so $AB = MBAM^{1}$ is similar to BA .

(b). Find a diagonalizable matrix $A \neq 0$ that is similar to -A. Also find a nondiagonalizable matrix A that is similar to -A.

$$A = \begin{pmatrix} 1 & 0 \\ 0 & -1 \end{pmatrix}$$
$$A = \begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix}$$
